BIOSPHERE SHIP

THE ANDROMEDAN VIERA

1/3

This information is given by women and men from the star Taygeta, in the cluster of the Pleiades. They are different conversations kept live in writing over the internet and reorganized by theme. We keep their original text without any modification.

They can be found in video format on YouTube, on the Pleiadian Knowledge channel of Cristina Álvarez and Estel·la Fernández.

Start date of the contact: 12th June 2020

Cristina: What is the Andromedan Viera like?

Anéeka of Temmer: The Andromedan biospherical ship Viera is a small vessel by their standards. It is 811 kilometres long, by about 300 kilometres wide at the back, and about 50 kilometres high in total. It is an arrowhead in shape.

Unlike other Andromedan biosphere ships, which are spherical and much larger, this one is considered an exploration ship because of its increased agility. Still, it is a biospherical ship that has a recognisable traditional spaceship shape. That is, up front it is narrow with control systems, and in the back it has many huge, gigantic, engines set in clusters.

Swaruu from Erra did some CGI of the Viera:

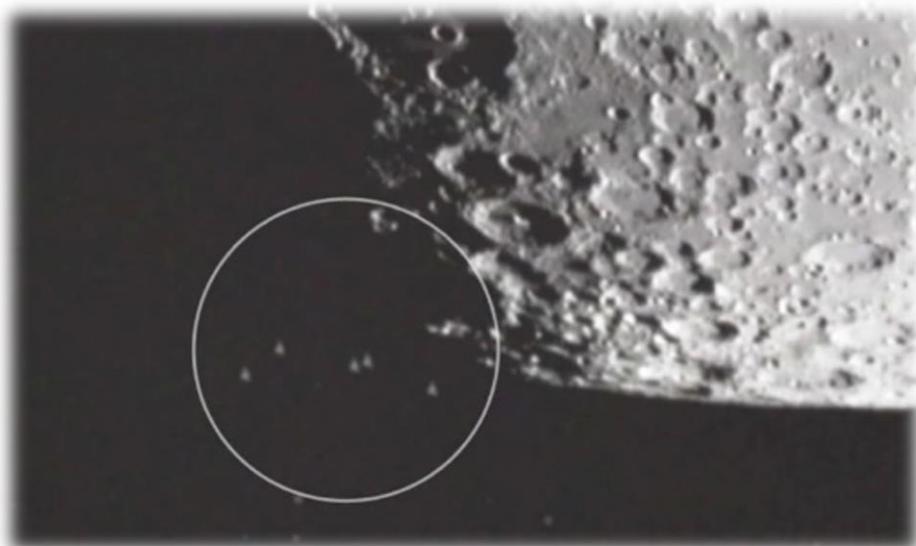

She used a Star Wars ship as a base to alter it to look like the Viera. It's very difficult to make a CGI from scratch. You have to alter an existing one.

There is a sister ship, the Varena, orbiting Venus at the moment. They are the same.

Cristina: It's very big indeed! So the shape is like a triangle?

Anéeka of Temmer: Yes. It is a long, pointed triangle. It has two biospheric levels. The bottom is marine, and I've never been there. The top one is terrestrial, which is what they call it.

This giant craft hides behind the moon in high orbit, about 490,000 km from Earth. It uses the moon as a shield so it can't be seen. But there are reports that something has been sighted behind the moon.

Cristina: So it orbits with the moon? I mean, do they go like together?

Anéeka of Temmer: Yes. Exactly. Using the moon as a shield all the time. When you see the moon, right behind it is stationed the Viera, as well as most of the larger motherships of other races. They travel in an orbit called "Selene Centric Orbit."

This means that their orbits are based on the moon. That is, they orbit the moon, not the Earth. The Viera orbits at such low revolutions that it never exposes itself to the Earth, just as the moon never exposes its hidden side to the Earth (in fact, the Viera does rotate the moon, but you always see the same lunar hologram projected nevertheless, no matter what the lunar surface is. It gives you the same, fixed illusion).

Cristina: Thank you. And the Viera, what engines does it have?

Anéeka of Temmer: The Viera has 16 huge plasma-jet engines, and gravity engines too. It has interstellar capability. Despite its size it is capable of jumping into hyperspace like any other ship. It has zero point reactors. I don't know how many, but it's a lot.

Estel·la: What materials is the Viera made of?

Anéeka of Temmer: Of a material that is a nano-technological metal. That is to say that the molecules of the metal align themselves to form the hull.

These kinds of big ships, including this one, are made of a metal that is intelligent. You programme the powder of the metal, and it takes the shape you want it to take, following the pattern imposed by the computer. In other words, it solidifies once it is in place.

Estel·la: What are the Andromedans' small ships like? Do the Viera have fighter-type ships onboard as well?

Anéeka of Temmer: Mostly discoidal. Some are egg-shaped, or they are flattened elliptical craft. Other races' fighters, such as those of the Antarians or the Centauri (the Alfrateans), fly from, or emerge from, the Viera. In the past the Taygetan's ships also flew from the Viera. The last ship of ours out of there was Yazhi's Suzy.

Andromedans have no fighter fleet. They depend on allies.

Estel·la: I understand. Thank you. Regarding the egg-shaped or flattened elliptical ships, what kind of missions do they use them for?

Anéeka of Temmer: They are mostly cargo or transport ships. Discoidal ones are ships for transporting people.

Estel·la: I mean, don't they ever use these kinds of ships to get close to Earth?

Anéeka of Temmer: In that case, they would use the discoidal ones. The others are purely utilitarian. Andromedans are not much for using ships of many kinds. They are more devoted to their huge spherical biosphere ships, and other shapes, such as the arrow ship.

Cristina: What is the difference between the moon's biospherical craft shape, and the Viera's? Apart from the form itself.

Anéeka of Temmer: The Moon is a major biospherical type spacecraft that inside contains layers, like an onion with different types of ecosystems. The marine ones are near the core, and the surface remained a solid hull with nothing on the outside (i.e. few needed facilities, not suitable for living on the surface).

The Viera, on the other hand, only has two levels. One on top of the other.

My note: I'm very impressed by how they built something like the Viera. A ship that big. A whole country in size. It escapes the understanding of spacecraft construction.

Estel·la: Yes, it is incredible! What is the original name of the ship that we call our moon?

Anéeka of Temmer: Creiddylad.

Estel·la: Does it have any meaning? I guess it's Andromedan...

Anéeka of Temmer: Yes, it is Andromedan, translated into phonemes. On Earth it would be interpreted as "Welsh Goddess." This goddess is surely connected to Diana. Wales, Ireland and Scotland have strong links to pre-dynastic Egypt, and to Atlantis. Hence the names.

Cristina: Diana?

Anéeka of Temmer: Diana is one of the names for the moon.

Creiddylad, also known as Creirddylad, Creurdilad, Creudylad or Kreiddylat, daughter of King Lludd. She is a secondary character in the medieval Welsh tale; Culhwch ac Olwen. The oldest Arthurian tale.

Diana: Roman Goddess of the Moon.

Estel·la: Thank you. How interesting.

Cristina: And the Andromedan ship at Venus, the Varena, how do they hide it there?

Anéeka of Temmer: They only hide it with their own invisibility systems. Not so much to hide it from Venusians' eyes, that is, from its surface, but because it could be seen from Earth. The Viera, on the other hand, does not have its invisibility systems activated.

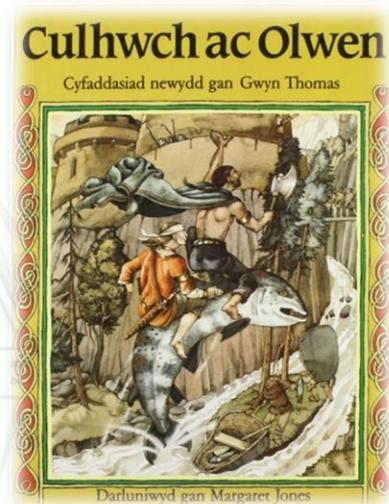

Estel·la: Would it be visible from here, like a star?

Anéeka of Temmer: Yes, with a telescope it would look like a Venusian satellite, a triangle.

Cristina: What a weird satellite it would be with that shape! But of course, if NASA says it's natural, it's natural!

Anéeka of Temmer: Yes, yes, it is quite natural that there are arrowhead moons.

Cristina: And do those on Venus know of its existence? I mean, is the Varena hidden from them as the Viera is here?

Anéeka of Temmer: I don't know. But I understand that the Venusians are more aware of what is going on than the Earthlings.

Cristina: The Viera hiding behind the Moon can't be detected because of its mass or something? How does it protect itself from that?

Anéeka of Temmer: Yes. And I understand that they do detect it, but they don't tell the public. They also detect the 900+ large spacecraft in Earth orbit 24/7. It just doesn't reach the people.

Telescopes, even private ones, do spot the ships. But few dare to say what they see. Any telescope, 1000x or larger, can detect spacecraft stationed in orbit. It's not that difficult. Especially since there are many that exceed one kilometre in length.
